Variables and Data Types

Variable Assignment

>>>	x=5
>>>	X
5	

Calculations With Variables

>>> x+2	Sum of two variables
7 >>> x-2	Subtraction of two variables
>>> x*2	Multiplication of two variables
10 >>> x**2	Exponentiation of a variable
25 >>> x%2	Remainder of a variable
1 >>> x/float(2)	Division of a variable
2.5	

Types and Type Conversion

str()	'5', '3.45', 'True'	Variables to strings
int()	5, 3, 1	Variables to integers
float()	5.0, 1.0	Variables to floats
bool()	True, True, True	Variables to booleans

Asking For Help

>>> help(str)

Strings

```
>>> my string = 'thisStringIsAwesome'
>>> my string
'thisStringIsAwesome'
```

String Operations

```
>>> my string * 2
 'thisStringIsAwesomethisStringIsAwesome'
>>> my string + 'Innit'
 'thisStringIsAwesomeInnit'
>>> 'm' in my string
```

Lists

Also see NumPy Arrays

```
>>> a = 'is'
>>> b = 'nice'
>>> my list = ['my', 'list', a, b]
>>>  my list2 = [[4,5,6,7], [3,4,5,6]]
```

Selecting List Elements

Index starts at o

Subset

>>>	my_	_list[1]
>>>	my_	list[-3]
Clic		_

- >>> my list[1:3] >>> my list[1:] >>> my list[:3] >>> my list[:]
- **Subset Lists of Lists** >>> my list2[1][0]
- >>> my list2[1][:2]

Select item at index 1 Select 3rd last item

- Select items at index 1 and 2 Select items after index o Select items before index 3
- Copy my list
- my list[list][itemOfList]

List Operations

```
>>> my list + my list
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> my list * 2
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> my list2 > 4
```

List Methods

>>>	<pre>my_list.index(a)</pre>	Get the index of an item
>>>	<pre>my_list.count(a)</pre>	Count an item
>>>	<pre>my_list.append('!')</pre>	Append an item at a tim
>>>	<pre>my_list.remove('!')</pre>	Remove an item
>>>	<pre>del(my_list[0:1])</pre>	Remove an item
>>>	<pre>my_list.reverse()</pre>	Reverse the list
>>>	<pre>my_list.extend('!')</pre>	Append an item
>>>	<pre>my_list.pop(-1)</pre>	Remove an item
>>>	<pre>my_list.insert(0,'!')</pre>	Insert an item
>>>	<pre>my_list.sort()</pre>	Sort the list

String Operations

Index starts at o

```
>>> my string[3]
>>> my string[4:9]
```

String Methods

String methods	
>>> my_string.upper()	String to uppercase
>>> my_string.lower()	String to lowercase
>>> my_string.count('w')	Count String elements
>>> my_string.replace('e', 'i')	Replace String elements
>>> mv string.strip()	Strip whitespaces

Libraries

Add new cell above the

current one

Code and text are encapsulated by 3 basic cell types: markdown cells, code cells, and raw NBConvert cells.

Edit Cells

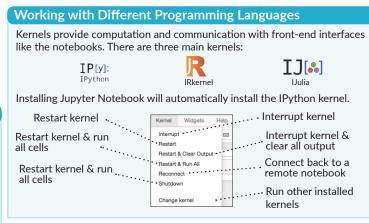

Cell

Insert Cell Relow

Add new cell below the

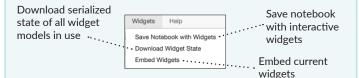

current one

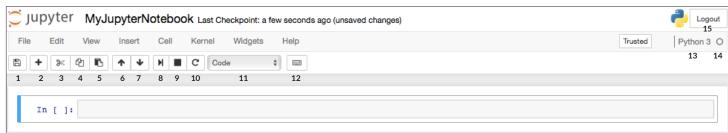

Widgets

Notebook widgets provide the ability to visualize and control changes in your data, often as a control like a slider, textbox, etc.

You can use them to build interactive GUIs for your notebooks or to synchronize stateful and stateless information between Python and JavaScript.

Command Mode:

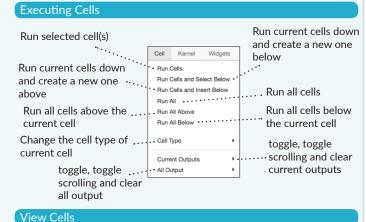

In []: |

Toggle display of Jupyter

Toggle line numbers

logo and filename

in cells

Toggle Header

Toggle Toolbar

Attachments

Raw cell format

8. Run current cell

- 9. Interrupt kernel
- 10. Restart kernel
- **11**. Display characteristics
- **12**. Open command palette
- 13. Current kernel
- 14. Kernel status
- **15**. Log out from notebook server

Asking For Help

1. Save and checkpoint

2. Insert cell below

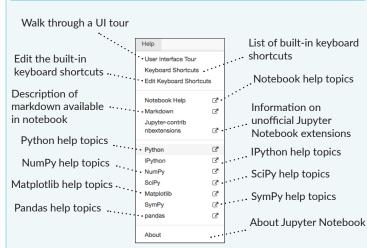

5. Paste cell(s) below

3. Cut cell

4. Copy cell(s)

6. Move cell up

7. Move cell down

NumPy Basics

Learn Python for Data Science Interactively at www.DataCamp.com

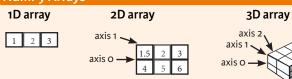

NumPy

The **NumPy** library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention: >>> import numpy as np

NumPy Arrays

Creating Arrays

```
>>> a = np.array([1,2,3])
>>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float)
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],
                 dtype = float)
```

Initial Placeholders

>>> np.zeros((3,4))	Create an array of zeros
>>> np.ones((2,3,4),dtype=np.int16)	Create an array of ones
>>> d = np.arange(10, 25, 5)	Create an array of evenly
	spaced values (step value)
>>> np.linspace(0,2,9)	Create an array of evenly
* * * * * * * * * * * * * * * * * * * *	spaced values (number of samples)
>>> e = np.full((2,2),7)	Create a constant array
	Create a 2X2 identity matrix
	Create an array with random values
>>> np.empty((3,2))	Create an empty array
<pre>>>> f = np.eye(2) >>> np.random.random((2,2)) >>> np.empty((3,2))</pre>	Create an array with random values

1/0

Saving & Loading On Disk

```
>>> np.save('my array', a)
>>> np.savez('array.npz', a, b)
>>> np.load('my array.npy')
```

Saving & Loading Text Files

>>>	np.loadtxt("myfile.txt")
>>>	<pre>np.genfromtxt("my file.csv", delimiter=',')</pre>
>>>	np.savetxt("mvarrav.txt", a, delimiter=" ")

Data Types

>>> np.int64	Signed 64-bit integer types
>>> np.float32	Standard double-precision floating point
>>> np.complex	Complex numbers represented by 128 floats
>>> np.bool	Boolean type storing TRUE and FALSE values
>>> np.object	Python object type
>>> np.string_	Fixed-length string type
>>> np.unicode_	Fixed-length unicode type

Inspecting Your Array

>>> a.	shape	Array dimensions
>>> le	n (a)	Length of array
>>> b.	ndim	Number of array dimensions
>>> e.	size	Number of array elements
>>> b.	dtype	Data type of array elements
>>> b.	dtype.name	Name of data type
>>> b.	astype(int)	Convert an array to a different type

Asking For Help

>>> np.info(np.ndarray.dtype)

Array Mathematics

Arithmetic Operations

>>> g = a - b array([[-0.5, 0., 0.],	Subtraction
[-3. , -3. , -3.]]) >>> np.subtract(a,b) >>> b + a array([[2.5, 4. , 6.],	Subtraction Addition
[5. , 7. , 9.]]) >>> np.add(b,a) >>> a / b array([[0.66666667, 1. , 1.],	Addition Division
>>> np.divide(a,b) >>> a * b array([[1.5, 4., 9.],	Division Multiplication
[4., 10., 18.]]) >>> np.multiply(a,b) >>> np.exp(b) >>> np.sqrt(b) >>> np.sin(a) >>> np.cos(b) >>> np.log(a)	Multiplication Exponentiation Square root Print sines of an array Element-wise cosine Element-wise natural logarith
>>> e.dot(f) array([[7., 7.],	Dot product

Comparison

>>> a == b array([[False, True, True],	Element-wise comparison
<pre>[False, False, False]], dtype=bool) >>> a < 2 array([True, False, False], dtype=bool)</pre>	Element-wise comparison
>>> np.array equal(a, b)	Array-wise comparison

Aggregate Functions

>>> a.sum()	Array-wise sum
>>> a.min()	Array-wise minimum value
>>> b.max(axis=0)	Maximum value of an array row
>>> b.cumsum(axis=1)	Cumulative sum of the elements
>>> a.mean()	Mean
>>> b.median()	Median
>>> a.corrcoef()	Correlation coefficient
>>> np.std(b)	Standard deviation

Copying Arrays

>>> h = a.view()	Create a view of the array with the same data
>>> np.copy(a)	Create a copy of the array
>>> h = a.copy()	Create a deep copy of the array

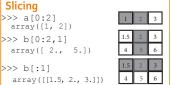

Sorting Arrays

	Sort an array
>>> c.sort(axis=0)	Sort the elements of an array's axis

Subsetting, Slicing, Indexing

Also see Lists

Subsetting 1 2 3 Select the element at the 2nd index >>> a[2] 1.5 2 3 >>> b[1,2]

1 2 3

>>> c[1,...] array([[[3., 2., 1.], [4., 5., 6.]]]) >>> a[: :-1]

array([3, 2, 1]) **Boolean Indexing** >>> a[a<2]

6.0

```
array([1])
Fancy Indexing
>>> b[[1, 0, 1, 0], [0, 1, 2, 0]]
 array([ 4. , 2. , 6. , 1.5])
>>> b[[1, 0, 1, 0]][:,[0,1,2,0]]
```

Select the element at row o column 2 (equivalent to b[1][2])

Select items at index 0 and 1

Select items at rows 0 and 1 in column 1

```
Select all items at row o
(equivalent to b[0:1, :])
Same as [1,:,:]
```

Reversed array a

Select elements from a less than 2

Select elements (1,0), (0,1), (1,2) and (0,0)

Select a subset of the matrix's rows and columns

Array Manipulation

Transposing Array

```
>>> i = np.transpose(b)
>>> i.T
```

Changing Array Shape >>> b.ravel()

```
>>> g.reshape(3,-2)
```

Adding/Removing Elements

>>>	h.resize((2,6))
>>>	np.append(h,g)
>>>	np.insert(a, 1, 5)
>>>	nn delete(a.[1])

Combining Arrays

```
>>> np.concatenate((a,d),axis=0)
  array([ 1, 2, 3, 10, 15, 20])
>>> np.vstack((a,b))
 array([[ 1., 2., 3.], [ 1.5, 2., 3.], [ 4., 5., 6.]])
>>> np.r [e,f]
>>> np.hstack((e,f))
array([[ 7., 7., 1., 0.],
         [ 7., 7., 0., 1.]])
>>> np.column stack((a,d))
  array([[ 1, 10],
           2, 15],
          [ 3, 20]])
>>> np.c [a,d]
```

Splitting Arrays

```
>>> np.hsplit(a,3)
[array([1]),array([2]),array([3])]
>>> np.vsplit(c,2)
```

Permute array dimensions Permute array dimensions

Flatten the array Reshape, but don't change data

Return a new array with shape (2,6)

Append items to an array Insert items in an array Delete items from an array

Concatenate arrays

Stack arrays vertically (row-wise)

Stack arrays vertically (row-wise) Stack arrays horizontally (column-wise)

Create stacked column-wise arrays

Create stacked column-wise arrays

Split the array horizontally at the 3rd

Split the array vertically at the 2nd index

Python For Data Science *Cheat Sheet* SciPv - Linear Algebra

Learn More Python for Data Science Interactively at www.datacamp.com

SciPy

The **SciPy** library is one of the core packages for scientific computing that provides mathematical algorithms and convenience functions built on the NumPy extension of Python.

Interacting With NumPy

Also see NumPv

```
>>> import numpy as np
>>> a = np.array([1,2,3])
>>> b = np.array([(1+5j,2j,3j), (4j,5j,6j)])
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]])
```

Index Tricks

	>>>	np.mgrid[0:5,0:5]	Create a dense meshgrid
2	>>>		Create an open meshgrid
1	>>>		Stack arrays vertically (row-wise)
1	>>>	np.c [b,c]	Create stacked column-wise arrays

Shape Manipulation

	<pre>np.transpose(b) b.flatten()</pre>	Permute array dimensions Flatten the array
>>>	np.hstack((b,c))	Stack arrays horizontally (column-wise)
>>>	np.vstack((a,b))	Stack arrays vertically (row-wise)
>>>	np.hsplit(c,2)	Split the array horizontally at the 2nd index
>>>	np.vpslit(d,2)	Split the array vertically at the 2nd index

Polynomials

p = poly1d([3,4,5])	Create a polynomial objec

Vectorizing Functions

```
>>> def myfunc(a):
         if a < 0:
           return a*2
         else.
           return a/2
>>> np.vectorize(myfunc)
                                     Vectorize functions
```

Type Handling

Other Useful Functions

>>>	np.angle(b,deg=True)	Return the angle of the complex argument
>>>	g = np.linspace(0,np.pi,num=5)	Create an array of evenly spaced values
>>>	g [3:] += np.pi	(number of samples)
>>>	np.unwrap(g)	Unwrap
>>>	np.logspace(0,10,3)	Create an array of evenly spaced values (log scale)
>>>	np.select([c<4],[c*2])	Return values from a list of arrays depending on
		conditions
>>>	misc.factorial(a)	Factorial
>>>	misc.comb(10,3,exact=True)	Combine N things taken at k time
>>>	misc.central_diff_weights(3)	Weights for Np-point central derivative
>>>	misc.derivative(myfunc, 1.0)	Find the n-th derivative of a function at a point

Deturn the angle of the complex argument

Linear Algebra Also see NumPy

You'll use the linalg and sparse modules. Note that scipy.linalg contains and expands on numpy.linalg.

```
>>> from scipy import linalg, sparse
```

Creating Matrices

>>>	Α	=	<pre>np.matrix(np.random.random((2,2)))</pre>
>>>	В	=	np.asmatrix(b)
>>>	С	=	<pre>np.mat(np.random.random((10,5)))</pre>
>>>	D	=	np.mat([[3,4], [5,6]])

Pandas Basics

Learn Python for Data Science Interactively at www.DataCamp.com

Pandas

The **Pandas** library is built on NumPy and provides easy-to-use data structures and data analysis tools for the Python programming language.

Use the following import convention:

>>> import pandas as pd

Pandas Data Structures

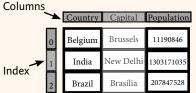

Series

A one-dimensional labeled array capable of holding any data type

```
>>> s = pd.Series([3, -5, 7, 4], index=['a', 'b', 'c', 'd'])
```

DataFrame

A two-dimensional labeled data structure with columns of potentially different types

```
>>> data = {'Country': ['Belgium', 'India', 'Brazil'],
           'Capital': ['Brussels', 'New Delhi', 'Brasília'],
           'Population': [11190846, 1303171035, 207847528]}
>>> df = pd.DataFrame(data,
                     columns=['Country', 'Capital', 'Population'])
```

Asking For Help

>>> help(pd.Series.loc)

Selection

Also see NumPy Arrays

Getting

```
>>> s['b']
  -5
>>> df[1:1
   Country
             Capital Population
  1 India New Delhi 1303171035
  2 Brazil
             Brasília 207847528
```

Get one element

Get subset of a DataFrame

Selecting, Boolean Indexing & Setting

By Position

```
>>> df.iloc([0],[0])
 'Belgium'
>>> df.iat([0],[0])
 'Belgium'
```

column

Select single value by row &

By Label

>>> df.loc([0],	['Country'])
'Belgium'	
>>> df.at([0],	['Country'])
'Belgium'	

Select single value by row & column labels

Bv Label/Position

>>> df.ix[2]
Country Brazil
Capital Brasília
Population 207847528
>>> df.ix[:,'Capital']
0 Brussels
1 New Delhi

Select a single column of subset of columns

Select single row of subset of rows

Select rows and columns

Boolean Indexing

'New Delhi'

Brasília

>>> df.ix[1,'Capital']

>>> s[~(s > 1)]
>>> s[(s < -1) (s > 2)]
>>> df[df['Population']>1200000000]
Setting

Series s where value is not >1 s where value is <-1 or >2

>>> s['a'] = 6

Use filter to adjust DataFrame

Set index a of Series s to 6

Read and Write to SQL Query or Database Table

>>> engine = create engine('sglite:///:memory:')

>>> pd.read sgl("SELECT * FROM my table;", engine)

>>> from sqlalchemy import create engine

>>> pd.read csv('file.csv', header=None, nrows=5) >>> df.to csv('myDataFrame.csv')

Read and Write to Excel

Read and Write to CSV

```
>>> pd.read excel('file.xlsx')
>>> pd.to excel('dir/myDataFrame.xlsx', sheet name='Sheet1')
```

Read multiple sheets from the same file

```
>>> xlsx = pd.ExcelFile('file.xls')
>>> df = pd.read excel(xlsx, 'Sheet1')
```

>>> pd.read sql table('my table', engine) >>> pd.read sql query("SELECT * FROM my table;", engine)

read sql() is a convenience wrapper around read sql table() and read sql query()

>>> pd.to sql('myDf', engine)

Dropping

>>>	s.drop(['a', 'c'])	Drop values from rows (axis=0)
>>>	<pre>df.drop('Country', axi</pre>	s=1) Drop values from columns(axis=1)

Sort & Rank

```
>>> df.sort index()
                                           Sort by labels along an axis
>>> df.sort values(by='Country')
                                           Sort by the values along an axis
>>> df.rank(\overline{1})
                                           Assign ranks to entries
```

Retrieving Series/DataFrame Information

Basic Information

```
>>> df.shape
                             (rows,columns)
>>> df.index
                             Describe index
>>> df.columns
                             Describe DataFrame columns
                            Info on DataFrame
>>> df.info()
>>> df.count()
                            Number of non-NA values
```

Summary

	>>> df.sum() >>> df.cumsum() >>> df.min()/df.max()	Sum of values Cummulative sum of values Minimum/maximum values
>	<pre>>>> df.idxmin()/df.idxmax() >>> df.describe() >>> df.mean() >>> df.median()</pre>	Minimum/Maximum index value Summary statistics Mean of values Median of values

Applying Functions

```
>>> f = lambda x: x*2
                            Apply function
>>> df.apply(f)
                            Apply function element-wise
>>> df.applymap(f)
```

Data Alignment

Internal Data Alignment

NA values are introduced in the indices that don't overlap:

```
>>> s3 = pd.Series([7, -2, 3], index=['a', 'c', 'd'])
>>> s + s3
       10.0
       NaN
       5.0
 С
       7.0
```

Arithmetic Operations with Fill Methods

You can also do the internal data alignment yourself with the help of the fill methods:

```
>>> s.add(s3, fill value=0)
 a 10.0
      -5.0
 С
     5.0
 d
     7.0
>>> s.sub(s3, fill value=2)
>>> s.div(s3, fill value=4)
>>> s.mul(s3, fill value=3)
```

Scikit-Learn

Learn Python for data science Interactively at www.DataCamp.com

Scikit-learn

Scikit-learn is an open source Python library that implements a range of machine learning, preprocessing, cross-validation and visualization algorithms using a unified interface.

A Basic Example

```
>>> from sklearn import neighbors, datasets, preprocessing
>>> from sklearn.model_selection import train_test_split
>>> from sklearn.model_selection import train_test_split
>>> iris = datasets.load_iris()
>>> X, y = iris.data[:, :2], iris.target
>>> X_train, X_test, y_train, y_test=train_test_split(X, y, random_state=33)
>>> scaler = preprocessing.StandardScaler().fit(X_train)
>>> X_train = scaler.transform(X_train)
>>> X_test = scaler.transform(X_test)
>>> knn = neighbors.KNeighborsClassifier(n_neighbors=5)
>>> knn.fit(X_train, y_train)
>>> y_pred = knn.predict(X_test)
>>> accuracy_score(y_test, y_pred)
```

Loading The Data

Also see NumPy & Pandas

Your data needs to be numeric and stored as NumPy arrays or SciPy sparse matrices. Other types that are convertible to numeric arrays, such as Pandas DataFrame, are also acceptable.

```
>>> import numpy as np
>>> X = np.random.random((10,5))
>>> y = np.array(['M','M','F','F','M','F','M','F','F','F'])
>>> X[X < 0.7] = 0
```

Training And Test Data

Create Your Model

Supervised Learning Estimators

Linear Regression

```
>>> from sklearn.linear model import LinearRegression >>> lr = LinearRegression(normalize=True)
```

Support Vector Machines (SVM)

```
>>> from sklearn.svm import SVC
>>> svc = SVC(kernel='linear')
```

Naive Bayes

>>> from sklearn.naive_bayes import GaussianNB
>>> gnb = GaussianNB()

KNN

>>> from sklearn import neighbors
>>> knn = neighbors.KNeighborsClassifier(n neighbors=5)

Unsupervised Learning Estimators

Principal Component Analysis (PCA)

>>> from sklearn.decomposition import PCA
>>> pca = PCA(n components=0.95)

K Means

>>> from sklearn.cluster import KMeans

>>> k_means = KMeans(n_clusters=3, random_state=0)

Model Fitting

Supervised learning

>>> lr.fit(X, y)
>>> knn.fit(X_train, y_train)
>>> svc.fit(X train, y train)

Unsupervised Learning

>>> k_means.fit(X_train)

>>> pca_model = pca.fit_transform(X_train) Fit to data, then transform it

Fit the model to the data

Fit the model to the data

Prediction

Supervised Estimators

>>> y_pred = svc.predict(np.random.random((2,5)))
>>> y_pred = lr.predict(X_test)

>>> y_pred = knn.predict_proba(X_test) Unsupervised Estimators

>>> y pred = k means.predict(X test)

Predict labels
Predict labels
Estimate probability of a label

Predict labels in clustering algos

Preprocessing The Data

Standardization

- >>> from sklearn.preprocessing import StandardScaler
- >>> scaler = StandardScaler().fit(X_train)
 >>> standardized X = scaler.transform(X train)
- >>> standardized_X _ scaler.transform(X_test)

Normalization

- >>> from sklearn.preprocessing import Normalizer
 >>> scaler = Normalizer().fit(X_train)
 >>> normalized X = scaler.transform(X train)
- >>> normalized X = Scaler.transform(X_train)
 >>> normalized_X_test = scaler.transform(X_test)

Binarization

- >>> from sklearn.preprocessing import Binarizer
 >>> binarizer = Binarizer(threshold=0.0).fit(X)
- >>> binary_X = binarizer.transform(X)

Encoding Categorical Features

- >>> from sklearn.preprocessing import LabelEncoder
- >>> enc = LabelEncoder()
- >>> y = enc.fit_transform(y)

Imputing Missing Values

- >>> from sklearn.preprocessing import Imputer >>> imp = Imputer(missing values=0, strategy='mean', axis=0)
- >>> imp.fit transform(X train)

Generating Polynomial Features

- >>> from sklearn.preprocessing import PolynomialFeatures
 >>> poly = PolynomialFeatures(5)
- >>> poly.fit_transform(X)

Evaluate Your Model's Performance

Classification Metrics

Accuracy Score

- >>> knn.score(X test, y test)
- >>> from sklearn.metrics import accuracy score Metricscoring functions

Estimator score method

>>> from sklearn.metrics import accuracy_score Metr
>>> accuracy score(y test, y pred)

Classification Report

Confusion Matrix

>>> from sklearn.metrics import confusion_matrix
>>> print(confusion_matrix(y_test, y_pred))

Regression Metrics

Mean Absolute Error

- >>> from sklearn.metrics import mean_absolute_error >>> y true = [3, -0.5, 2]
- >>> mean_absolute_error(y_true, y_pred)

Mean Squared Error

- >>> from sklearn.metrics import mean squared error
- >>> mean_squared_error(y_test, y_pred)

R² Score

>>> from sklearn.metrics import r2_score >>> r2 score(y true, y pred)

Clustering Metrics

Adjusted Rand Index

>>> from sklearn.metrics import adjusted_rand_score >>> adjusted rand score(y true, y pred)

Homogeneity

- >>> from sklearn.metrics import homogeneity_score
- >>> homogeneity_score(y_true, y_pred)

V-measure

>>> from sklearn.metrics import v_measure_score
>>> metrics.v measure score(y true, y pred)

Cross-Validation

- >>> from sklearn.cross validation import cross val score
- >>> print(cross_val_score(knn, X_train, y_train, cv=4))
 >>> print(cross_val_score(lr, X, y, cv=2))

Tune Your Model

Grid Search

- >>> from sklearn.grid_search import GridSearchCV
 >>> params = {"n neighbors": np.arange(1,3),
- "metric": ["euclidean", "cityblock"]}
 >>> grid = GridSearchCV(estimator=knn,
- param_grid=params)
- - Pandomized Parameter Ontimization

Randomized Parameter Optimization

- >>> from sklearn.grid search import RandomizedSearchCV
 >>> params = {"n neighbors": range(1,5),
- param distributions=params cv=4, n iter=8,
- random_state=5)
 >>> rsearch.fit(X train, y train)
- >>> print(rsearch.best_score_)

Python For Data Science Cheat Sheet Matplotlib

Learn Python Interactively at www.DataCamp.com

Matplotlib

Matplotlib is a Python 2D plotting library which produces publication-quality figures in a variety of hardcopy formats and interactive environments across platforms.

Prepare The Data

Also see Lists & NumPy

```
>>> import numpy as np
>>> x = np.linspace(0, 10, 100)
>>> v = np.cos(x)
>>> z = np.sin(x)
```

2D Data or Images

```
>>> data = 2 * np.random.random((10, 10))
>>> data2 = 3 * np.random.random((10, 10))
>>> Y, X = np.mgrid[-3:3:100j, -3:3:100j]
>>> U = -1 - X**2 + Y
>>> V = 1 + X - Y**2
>>> from matplotlib.cbook import get sample data
>>> img = np.load(get sample data('axes grid/bivariate normal.npy'))
```

Create Plot

```
>>> import matplotlib.pyplot as plt
```

```
>>> fig = plt.figure()
>>> fig2 = plt.figure(figsize=plt.figaspect(2.0))
```

All plotting is done with respect to an Axes. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

```
>>> fig.add axes()
>>> ax1 = fig.add subplot(221) # row-col-num
>>> ax3 = fig.add subplot(212)
>>> fig3, axes = plt.subplots(nrows=2,ncols=2)
>>> fig4, axes2 = plt.subplots(ncols=3)
```

Plot Anatomy & Workflow

Workflow

```
The basic steps to creating plots with matplotlib are:
       1 Prepare data 2 Create plot 3 Plot 4 Customize plot 5 Save plot 6 Show plot
                >>> import matplotlib.pyplot as plt
               >>> x = [1,2,3,4]
               >>> y = [10, 20, 25, 30]
                >>> fig = plt.figure() < Step 2
                >>> ax = fig.add subplot(111) < Step 3
                >>> ax.plot(x, y, color='lightblue', linewidth=3) Step 3, 4
                >>> ax.scatter([2,4,6],
                                [5, 15, 25],
                                color='darkgreen',
                                marker='^')
```

Customize Plot

Colors, Color Bars & Color Maps

```
>>> plt.plot(x, x, x, x**2, x, x**3)
>>> ax.plot(x, y, alpha = 0.4)
>>> ax.plot(x, y, c='k')
>>> fig.colorbar(im, orientation='horizontal')
>>> im = ax.imshow(img,
                   cmap='seismic')
```

Markers

```
>>> fig, ax = plt.subplots()
>>> ax.scatter(x,y,marker=".")
>>> ax.plot(x,y,marker="o")
```

```
>>> plt.plot(x,y,linewidth=4.0)
>>> plt.plot(x,y,ls='solid')
>>> plt.plot(x,y,ls='--')
>>> plt.plot(x,y,'--',x**2,y**2,'-.')
>>> plt.setp(lines,color='r',linewidth=4.0)
```

Text & Annotations

```
>>> ax.text(1,
            -2.1,
           'Example Graph',
           style='italic')
>>> ax.annotate("Sine",
                 xy = (8, 0),
                 xycoords='data'
                 xytext = (10.5, 0),
                 textcoords='data',
                 arrowprops=dict(arrowstyle="->",
                             connectionstyle="arc3"),)
```

Mathtext

>>> plt.show()

>>> ax.set xlim(1, 6.5)

>>> plt.savefig('foo.png')

>>> plt.title(r'\$sigma i=15\$', fontsize=20)

Limits, Legends & Layouts

Limits & Autoscaling

```
>>> ax.margins(x=0.0,y=0.1)
                                                            Add padding to a plot
>>> ax.axis('equal')
                                                            Set the aspect ratio of the plot to 1
>>> ax.set(xlim=[0,10.5],ylim=[-1.5,1.5])
                                                            Set limits for x-and v-axis
                                                            Set limits for x-axis
>>> ax.set xlim(0,10.5)
 Leaends
>>> ax.set(title='An Example Axes',
                                                            Set a title and x-and y-axis labels
             vlabel='Y-Axis',
             xlabel='X-Axis')
>>> ax.legend(loc='best')
                                                            No overlapping plot elements
```

>>> ax.xaxis.set(ticks=range(1,5), Manually set x-ticks

```
ticklabels=[3,100,-12,"foo"])
>>> ax.tick params(axis='y',
                   direction='inout',
```

length=10) Subplot Spacing

>>> fig3.subplots adjust(wspace=0.5, Adjust the spacing between subplots hspace=0.3, left=0.125,

right=0.9, top=0.9, bottom=0.1) >>> fig.tight_layout()

Fit subplot(s) in to the figure area

Axis Spines

>>>	ax1.spines['top'].set visible(False)	
>>>	ax1.spines['bottom'].set position(('outward',10))	

Make the top axis line for a plot invisible Move the bottom axis line outward

Make y-ticks longer and go in and out

Plotting Routines

```
>>> fig, ax = plt.subplots()
>>> lines = ax.plot(x,y)
>>> ax.scatter(x,y)
>>> axes[0,0].bar([1,2,3],[3,4,5])
>>> axes[1,0].barh([0.5,1,2.5],[0,1,2])
>>> axes[1,1].axhline(0.45)
>>> axes[0,1].axvline(0.65)
>>> ax.fill(x,y,color='blue')
>>> ax.fill between(x,y,color='yellow')
```

Draw points with lines or markers connecting them Draw unconnected points, scaled or colored Plot vertical rectangles (constant width) Plot horiontal rectangles (constant height)

Draw a horizontal line across axes Draw a vertical line across axes Draw filled polygons Fill between v-values and o

Vector Fields

	axes[0,1].arrow(0,0,0.5,0.5) axes[1,1].quiver(y,z)	Add an arrow to the axes
>>>	axes[0,1].streamplot(X,Y,U,V)	Plot a 2D field of arrows

Data Distributions

2D Data or Images

>>> fig, ax = plt.subplots()

>>>	im =	ax.imshow(img,
		cmap='gist earth',
		interpolation='nearest'
		vmin=-2,
		11m 23z=21

Colormapped or RGB arrays

>>>	axes2[0].pcolor(data2)
>>>	axes2[0].pcolormesh(data)
>>>	CS = plt.contour(Y,X,U)
>>>	axes2[2].contourf(data1)
>>>	aves2[2]= av clahel(CS)

Pseudocolor plot of 2D array Pseudocolor plot of 2D array Plot contours Plot filled contours Label a contour plot

Save Plot

Save figures >>> plt.savefig('foo.png') Save transparent figures >>> plt.savefig('foo.png', transparent=True)

Show Plot

>>> plt.show()

Close & Clear

>>> plt.cla()	Clear an axis
>>> plt.clf()	Clear the entire figu
>>> plt.close()	Close a window

Python For Data Science Cheat Sheet (3) Plotting With Seaborn

Seaborn

Learn Data Science Interactively at www.DataCamp.com

Statistical Data Visualization With Seaborn

The Python visualization library Seaborn is based on matplotlib and provides a high-level interface for drawing attractive statistical graphics.

Make use of the following aliases to import the libraries:

```
>>> import matplotlib.pyplot as plt
>>> import seaborn as sns
```

The basic steps to creating plots with Seaborn are:

- 1. Prepare some data
- 2. Control figure aesthetics
- 3. Plot with Seaborn
- 4. Further customize your plot

```
>>> import matplotlib.pyplot as plt
>>> import seaborn as sns
>>> tips = sns.load dataset("tips")
                                         Step 1
>>> sns.set style("whitegrid")
>>> g = sns.lmplot(x="tip",
                                         Step 3
                   v="total bill",
                   data=tips,
                   aspect=2)
>>> g = (g.set axis labels("Tip", "Total bill(USD)").
set(xlim=(0,10),ylim=(0,100)))
>>> plt.title("title")
>>> plt.show(q)
```

Data

Seaborn styles

>>> sns.set()

Also see Lists, NumPy & Pandas

```
>>> import pandas as pd
>>> import numpy as np
>>> uniform data = np.random.rand(10, 12)
>>> data = pd.DataFrame({'x':np.arange(1,101),
                          y':np.random.normal(0,4,100)})
```

Seaborn also offers built-in data sets:

```
>>> titanic = sns.load dataset("titanic")
>>> iris = sns.load dataset("iris")
```

{"xtick.major.size":8,

Axis Grids

```
>>> g = sns.FacetGrid(titanic,
                      col="survived",
                       row="sex")
>>> g = g.map(plt.hist, "age")
>>> sns.factorplot(x="pclass",
                   y="survived",
                   hue="sex",
                   data=titanic)
>>> sns.lmplot(x="sepal width",
               y="sepal length",
               hue="species",
               data=iris)
```

Subplot grid for plotting conditional relationships

Draw a categorical plot onto a Facetgrid

Plot data and regression model fits across a FacetGrid

>>> h = sns.PairGrid(iris)	Subplot grid for plotting pairwise
>>> h = h.map(plt.scatter)	relationships
>>> sns.pairplot(iris)	Plot pairwise bivariate distributions
>>> i = sns.JointGrid(x="x",	Grid for bivariate plot with marginal
y="y",	univariate plots
data=data)	
>>> i = i.plot(sns.regplot,	
sns.distplot)	
>>> sns.jointplot("sepal_length",	Plot bivariate distribution
"sepal_width",	
data=iris,	

Categorical Plots

```
Scatterplot
                                                  Scatterplot with one
>>> sns.stripplot(x="species",
                                                  categorical variable
                    v="petal length",
                    data=iris)
>>> sns.swarmplot(x="species",
                                                  Categorical scatterplot with
                                                  non-overlapping points
                    y="petal length",
                    data=iris)
Bar Chart
                                                  Show point estimates and
>>> sns.barplot(x="sex",
                                                  confidence intervals with
                y="survived",
                hue="class",
                                                  scatterplot glyphs
                data=titanic)
Count Plot
>>> sns.countplot(x="deck",
                   data=titanic,
                   palette="Greens d")
Point Plot
                                                  Show point estimates and
>>> sns.pointplot(x="class",
                    v="survived",
```

Show count of observations

confidence intervals as rectangular bars

Boxplot

```
v="age",
                hue="adult male",
                data=titanic)
>>> sns.boxplot(data=iris,orient="h")
Violinplot
```

>>> sns.boxplot(x="alive",

>>> sns.violinplot(x="age", y="sex",

hue="sex",

data=titanic,

palette={"male":"g",

linestyles=["-","--"])

markers=["^","o"],

hue="survived",

data=titanic)

"female": "m" },

Violin plot

Boxplot with wide-form data

Also see Matplotlib

Boxplot

Regression Plots

```
Plot data and a linear regression
>>> sns.regplot(x="sepal width",
                                         model fit
                  v="sepal length",
                  data=iris,
                  ax=ax
```

kind='kde')

Distribution Plots

```
>>> plot = sns.distplot(data.y,
                                         Plot univariate distribution
                           kde=False,
                           color="b")
```

Matrix Plots

>>> sns.heatmap(uniform data,vmin=0,vmax=1) Heatmap

Further Customizations

Axisarid Objects

```
>>> g.despine(left=True)
                                         Remove left spine
>>> g.set ylabels("Survived")
                                        Set the labels of the y-axis
                                        Set the tick labels for x
>>> g.set xticklabels(rotation=45
                                        Set the axis labels
>>> g.set axis labels("Survived",
                          "Sex")
                                        Set the limit and ticks of the
>>> h.set(xlim=(0,5),
           ylim = (0, 5),
                                        x-and y-axis
           xticks=[0,2.5,5],
           yticks=[0,2.5,5])
```

Plot

>>> plt.title("A Title") >>> plt.ylabel("Survived")	Add plot title Adjust the label of the y-axis
>>> plt.xlabel("Sex")	Adjust the label of the x-axis
>>> plt.ylim(0,100)	Adjust the limits of the y-axis
>>> plt.xlim(0,10)	Adjust the limits of the x-axis
>>> plt.setp(ax,yticks=[0,5])	Adjust a plot property
>>> plt.tight_layout()	Adjust subplot params

Figure Aesthetics

Plotting With Bokeh

The Python interactive visualization library **Bokeh** enables high-performance visual presentation of large datasets in modern web browsers.

Bokeh's mid-level general purpose bokeh.plotting interface is centered around two main components: data and glyphs.

The basic steps to creating plots with the bokeh.plotting interface are:

1. Prepare some data:

Python lists, NumPy arrays, Pandas DataFrames and other sequences of values

- 2. Create a new plot
- 3. Add renderers for your data, with visual customizations
- 4. Specify where to generate the output
- 5. Show or save the results

1) Data

Also see Lists, NumPy & Pandas

Under the hood, your data is converted to Column Data Sources. You can also do this manually:

2) Plotting

>>> cds df = ColumnDataSource(df)

Glyphs

color="blue")

pd.DataFrame([[3,4,5],[3,2,1]]),

Customized Glyphs

Also see Data

Selection and Non-Selection Glyphs

Renderers & Visual Customizations

Hover Glyphs

- >>> from bokeh.models import HoverTool
 >>> hover = HoverTool(tooltips=None, mode='vline')
 >>> p3.add tools(hover)

Colormapping

Legend Location

Legend Orientation

```
>>> p.legend.orientation = "horizontal"
>>> p.legend.orientation = "vertical"
```

Legend Background & Border

```
>>> p.legend.border_line_color = "navy"
>>> p.legend.background_fill_color = "white"
```

Rows & Columns Layout

```
Rows
>>> from bokeh.layouts import row
>>> layout = row(p1,p2,p3)

Columns
>>> from bokeh.layouts import columns
>>> layout = column(p1,p2,p3)

Nesting Rows & Columns
>>>layout = row(column(p1,p2), p3)
```

Grid Layout

```
>>> from bokeh.layouts import gridplot
>>> row1 = [p1,p2]
>>> row2 = [p3]
>>> layout = gridplot([[p1,p2],[p3]])
```

Tabbed Layout

```
>>> from bokeh.models.widgets import Panel, Tabs
>>> tab1 = Panel(child=p1, title="tab1")
>>> tab2 = Panel(child=p2, title="tab2")
>>> layout = Tabs(tabs=[tab1, tab2])
```

Linked Plots

Output & Export

Notebook

```
>>> from bokeh.io import output_notebook, show >>> output notebook()
```

HTML

Standalone HTML

```
>>> from bokeh.embed import file html
>>> from bokeh.resources import CDN
>>> html = file html(p, CDN, "my plot")
```

```
>>> from bokeh.io import output_file, show
>>> output file('my bar chart.html', mode='cdn')
```

Components

```
>>> from bokeh.embed import components
>>> script, div = components(p)
```

PNG

```
>>> from bokeh.io import export_png
>>> export png(p, filename="plot.png")
```

SVG

```
>>> from bokeh.io import export_svgs
>>> p.output_backend = "svg"
>>> export_svgs(p, filename="plot.svg")
```

5) Show or Save Your Plots

-			
	>>> show(p1)	>>> show(layout)	
	>>> save(p1)	>>> save(layout)
